I created this HTML and CSS file to practice pseudo-classes and pseudo-elements. I used :link, :hover, :active, and :visited to style the link when I visit or click it. I applied :last-child to give the last paragraph a different background, and :nth-child(3n) to color every third <div>.

For headings, I used ::before and ::after to add heart icons before and after each <h3>. In the .z class, I styled the paragraph using ::first-letter to make the first letter big and red, and ::selection to change text style when I select it. One selector z p::first-line didn't work because I forgot the dot before z. Everything else works fine and helps me understand how these styles change element behavior and look.
